Cloud Management

Today’s enterprise is a hub of heterogeneous technologies that are complex and expensive to support, especially when you consider adopting cloud. If you’re considering a move to the cloud, you’re probably looking at:

- Trying to modernize legacy infrastructure and applications with tools that don’t work across mixed environments.
- Your organization’s need to gain agility with a consistent, automated path to adopting new cloud infrastructure, plus the ability to scale up or down on demand.
- Ensuring that security and compliance policies are consistent across all your environments — physical, virtual, cloud.

Puppet Enterprise helps unify physical, virtual and cloud environments by automating every part of your modern data center — simply, scalably, and securely. With a single integrated solution, you can:

- Streamline management of your compute, storage and network resources.
- Efficiently adopt cloud for building new applications.
- Scale workloads efficiently across heterogeneous environments.
- Do all this across various flavors of public, private and hybrid cloud.

85% of enterprises lack automation. 1 in 2 organizations believe cloud will help them improve their revenue.

Learn more at puppet.com
Modern tooling for modern practices

Puppet Enterprise is quick and easy to learn because it uses a simple declarative language that makes it possible to ramp up quickly while enabling modern practices such as DevOps, infrastructure as code and more agile practices.

Check out the library of Puppet Supported and Approved modules, available on the Puppet Forge. All have been tested for quality, so using these modules lets you start configuring your cloud infrastructure with confidence.

Automation for speed and agility

Easily adopt cloud and build new applications for greenfield projects. Rapidly move from your physical infrastructure to deploying production workloads in the cloud across all major platforms, including AWS, Microsoft, VMware, OpenStack and GCE. Quickly scale your infrastructure up or down to hand shifts in demand. Puppet Enterprise automatically discovers infrastructure, dynamically provisions operating systems based on policies you define, and enforces your desired state.

Enterprise reliability

Consistently enforce policies across thousands of cloud services and virtual networks to reduce risk and ensure reliable delivery with a single solution for:

- Physical, virtual, and cloud environments.
- Public, private, and hybrid clouds.
- Compute, network, and storage.
Why Puppet?

Thousands of companies rely on Puppet to manage their infrastructure and applications, including:

- **150%**
  
  increase in deployment frequency.

- **healthdirect**
  
  Deploys AWS infrastructure in minutes.

- **STAPLES**
  
  Deployment cycles have gone from weeks to hours, days to minutes.
